

PY32F072 Datasheet

32-bit ARM® Cortex®-M0+ Microcontroller

Puya Semiconductor (Shanghai) Co., Ltd

Features

- Core
 - ARM® 32-bit Cortex®-M0+ CPU
 - Up to 72 MHz operating frequency
- Memories
 - Maximum 128 KB Flash memory
 - Maximum 16 KB SRAM
- Clock management
 - Internal 4/8/16/22.12/24 MHz high speed clock (HSI)
 - Internal 32.768 kHz low speed clock (LSI)
 - External 4 to 32 MHz high speed crystal oscillator (HSE)
 - External 32.768 kHz low-speed crystal oscillator (LSE)
 - PLL (supports 2/3 multiplication of HSI or HSE)
- Power management and reset
 - Operating voltage: 1.7 ~ 5.5 V
 - Low power modes : Sleep and Stop
 - Power-on/power-down reset (POR/PDR)
 - Brown-out reset (BOR)
 - Programmable voltage detection (PVD)
- General-purpose input and output (I/O)
 - Up to 58 I/Os, all available as external interrupts
- 7-channel DMA controller
- Two 12-bit ADC
 - Up to 16 external input channels
 - Input voltage conversion range: 0 to V_{CCA}
- Two 12-bit DAC, supports 2 channels
- 3 analog comparators
- 3-channel operational amplifier
- Support 8 * 36 / 4 * 40 LCD
- 13 timers
 - One 16-bit advanced-control timer (TIM1)
 - One 32-bit general-purpose timer (TIM2)
 - Five 16-bit general-purpose timers (TIM3/14/15/16/17)
 - Two basic timers (TIM6/TIM7)
 - A low power timer (LPTIM)
 - A independent watchdog timer (IWDG)
 - A window watchdog timer (WWDG)
 - A SysTick timer
- RTC
- Communication interfaces
 - Two serial peripheral interfaces (SPI) with I²S function
 - Four universal synchronous/asynchronous Transceivers (USARTs) , support automatic baud rate detection, two of USARTs support ISO7816, LIN and IrDA
 - Two I²C interfaces supporting standard mode (100 kHz), Fast mode (400 kHz), 7-bit/10-bit addressing mode and SMBus
 - USB 2.0 full-speed interface
 - CAN 2.0 standard communication interface
- Hardware CRC-32 module
- Hardware 32-bit divider (DIV)
- Unique UID
- Serial wire debug (SWD)
- Operating temp: -40 ~ 85 °C, -40 ~ 105 °C
- Package: LQFP64, LQFP48, QFN48, QFN32 (5*5) , QFN32 (4*4)

1. Introduction

PY32F072 series microcontrollers incorporate high-performance ARM® 32-bit Cortex®-M0+ core, wide operating range voltage, embedded memories with up to 128 KB Flash and 32 KB SRAM, frequency up to 72 MHz, and contains various products in different package types. The chip integrates multi-channel I²C, SPI, USART and other communication peripherals, one 12-bit ADC, two DAC, 13 timers, one USB 2.0, one CAN 2.0, three comparators, three operational amplifiers, and one LCD driver.

PY32F072 series microcontrollers 's operate in the temperature range from -40 to 85°C or -40 to 105°C, and with operating voltages from 1.7 to 5.5 V. The chip provides sleep and stop low-power operating modes, which can meet different low-power applications.

The devices are suitable for various application scenarios, such as controllers, portable devices, PC peripherals, gaming and GPS platforms, industrial applications.

2. Functional Overview

2.1. Arm®-Cortex®-M0+ core

The Arm® Cortex®-M0+ is an entry-level Arm 32-bit Cortex processor designed for a wide range of embedded applications. It provides developers with significant benefits, including:

- Simple structure, easy to learn and program
- Ultra-low power consumption, energy-saving operation
- Reduced code density and more

Cortex-M0+ processor is a 32-bit core optimized for area and power consumption and is a 2-stage pipeline Von Neumann architecture. The processor offers high-end processing hardware, including single-cycle multipliers, through a streamlined but powerful instruction set and an extensively optimized design. Moreover, it delivers the superior performance expected from a 32-bit architecture computer, with a higher coding density than other 8 and 16-bit microcontrollers.

The Cortex-M0+ is tightly coupled with a Nested Vectored Interrupt Controller (NVIC).

2.2. Memories

The on-chip integrated SRAM is accessed by bytes (8 bits), half-word (16 bits) or word (32 bits).

The on-chip integrated Flash consists of two different physical areas:

- Main flash area contains application and user data
- Information area has 14 KB, and it includes the following parts:
 - Option bytes
 - UID bytes
 - System memory

The protection of Flash main memory includes the following mechanisms:

- Read protection (RDP) prevents outside access.
- Write protection (WRP) prevents unwanted write operation (confuse by program memory pointer from PC). The minimum protection unit for write protection is 8 KB .
- Option byte write protection is a special design for unlock.

2.3. Boot modes

At startup, the BOOT0 pin and boot selector option bit nBOOT are used to select one of the three boot options in the following table:

Table 2-1 Boot configuration

Boot mode configuration		Mode
nBOOT1 bit	BOOT0 pin	
X	0	Main flash as the boot area
1	1	System memory as the boot area
0	1	SRAM as the boot area

The Boot loader is located in the System memory and is used to download the Flash program through the USART interface.

2.4. Clock system

At startup, the default system clock frequency is HSI 8 MHz, and after the program is operating the system clock frequency and system clock source can be reconfigured. The frequency clocks that can be selected are:

- A 4/8/16/22.12/24 MHz configurable internal high precision HSI clock
- A 32.768 kHz configurable internal LSI clock
- A 4 to 32 MHz HSE clock, and used to enable the CSS function to detect HSE. If CSS fails, the hardware will automatically convert the system clock to HSI, and software configures the HSI frequency. Simultaneously, CPU NMI interrupt is generated.
- A 32.768 kHz LSE clock.
- PLL clock has HSI and HSE sources. If the HSE source is selected, when CSS is enabled and CSS fails, the PLL and HSE will be turned off, and the hardware selects the system clock source as HSI.

The AHB clock can be divided based on the system clock, and the APB clock can be divided based on the AHB clock. AHB and APB clock frequencies up to 72 MHz.

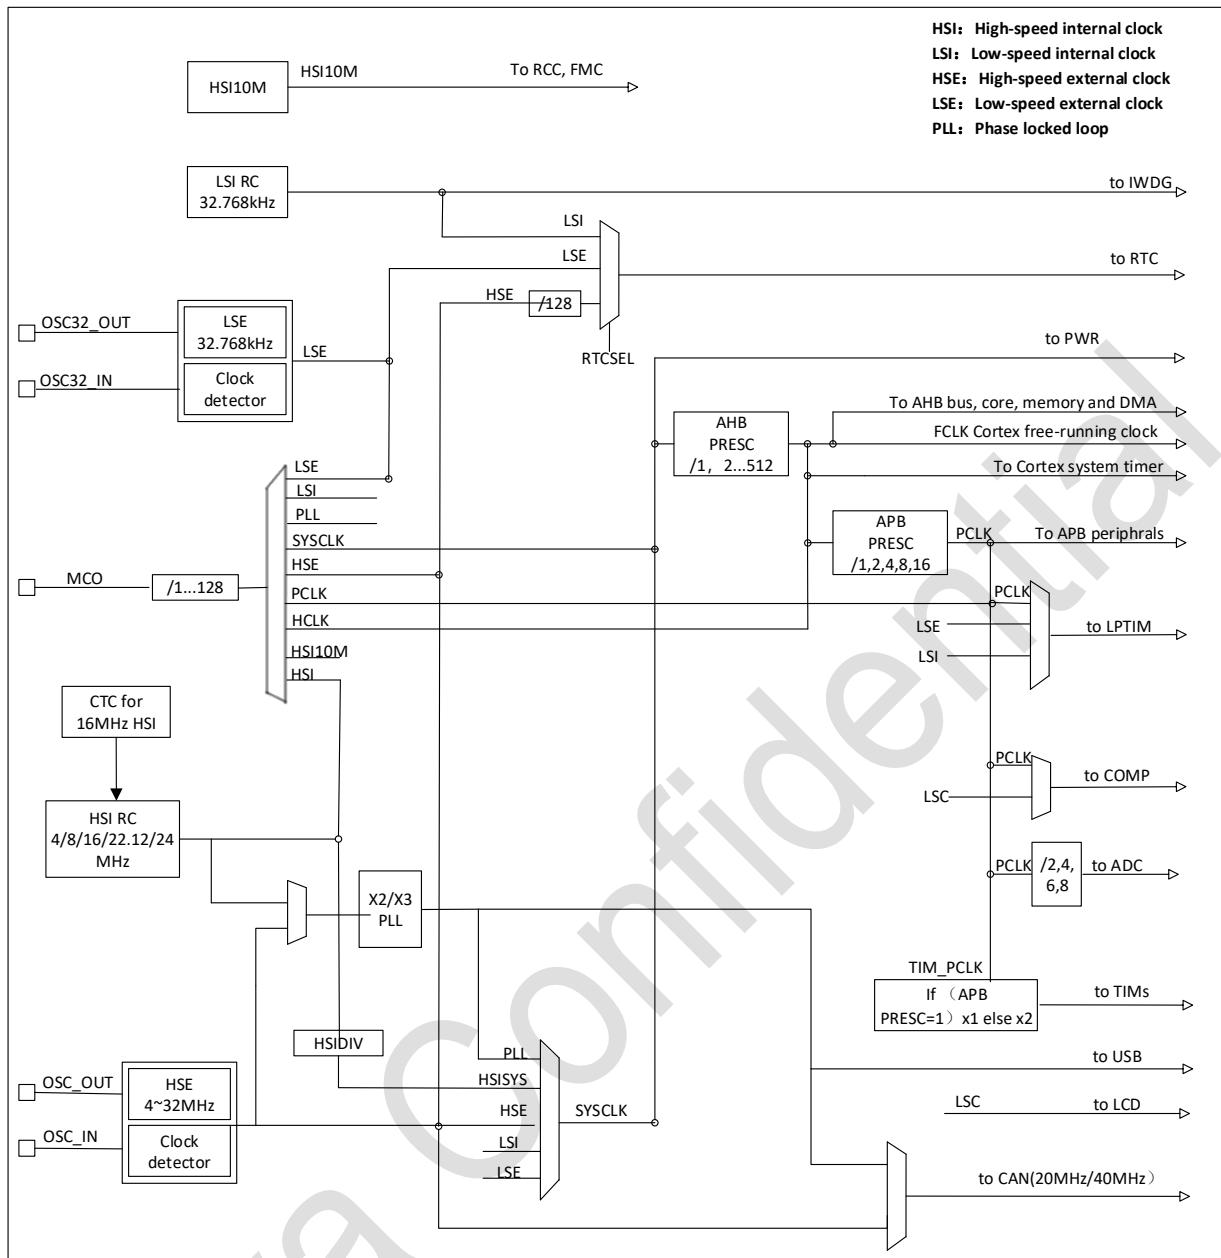

Figure 2-1 System Clock Structure Diagram

2.5. Power management

2.5.1. Power block diagram

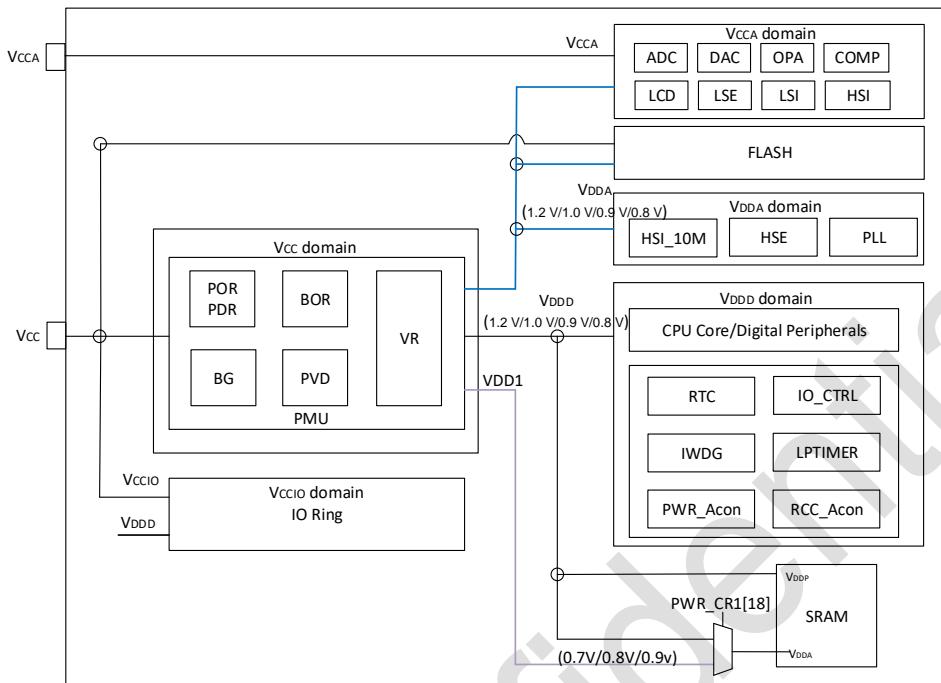

Figure 2-2 Power block diagram

Table 2-2 Power Block Diagram

No.	Power supply	Power value	Describe
1	V _{CC}	1.7 to 5.5 V	The chip is supplied power through the power pins.
2	V _{DDX} (V _{DDD} /V _{DDA})	1.2 V/1.0 V/0.9 V/0.8 V±10%	VR supplies power to the main logic circuits and SRAM inside the chip. When the MR is powered, it outputs 1.2 V. According to the software configuration, when entering the stop mode it powered by MR or LPR, and the LPR output is determined to be 1.2 V/1.0 V/0.9 V/0.8 V.
3	V _{VCCA}	1.7 to 5.5 V	The chip is supplied analog power through the power pins.

2.5.2. Power monitoring

2.5.2.1. Power on reset (POR/PDR)

The power-on reset (POR) and power-down reset (PDR) module is designed in the chip to provide power-on and power-off reset for the chip. The module keeps working in all modes.

2.5.2.2. Brown-out reset (BOR)

In addition to POR/ PDR, BOR (brown-out reset) is also implemented. BOR can only be enabled and disabled through the option byte .

When the BOR is turned on, the BOR threshold can be selected by the Option byte, and both the rising and falling detection points can be configured individually.

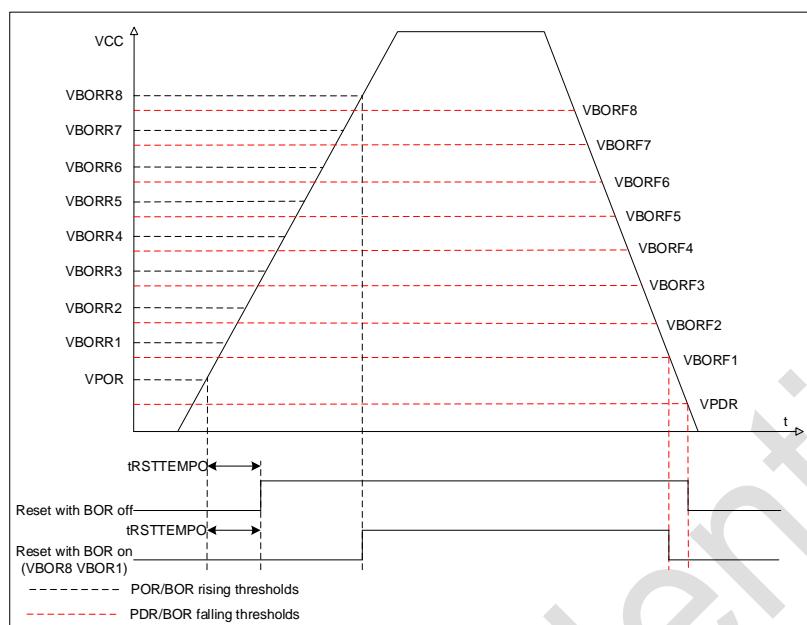

Figure 2-3 POR/PDR/BOR threshold

2.5.2.3. Programmable voltage detection (PVD)

Programmable voltage detector (PVD) module can be used to detect the V_{CC} power supply and the voltage of the PB7 pin, and the detection point is configured through the register. When V_{CC} is higher or lower than the detection point of PVD, the corresponding reset flag is generated.

This event is internally connected to line 16 of EXTI, depending on the rising/falling edge configuration of EXTI line 16, when V_{CC} rises above the detection point of PVD, or V_{CC} falls below the detection point of PVD, an interrupt is generated. In the service program, users can perform urgent shutdown tasks.

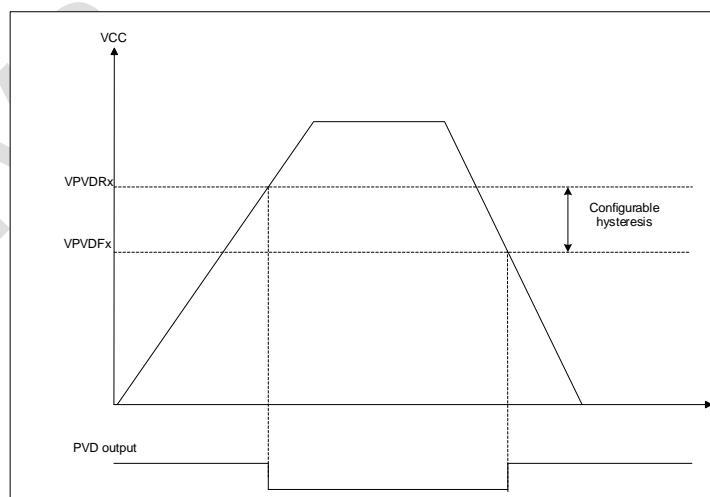

Figure 2-4 PVD threshold

2.5.3. Voltage regulator

The regulator has two operating modes:

- Main regulator (MR) is used in normal operating mode.
- Low power regulator (LPR) can be used in Stop mode where the power demand is reduced.

2.5.4. Low-power mode

In addition to the normal operating mode, the chip has 2 low-power modes:

- Sleep mode: Peripherals can be configured to keep working when the CPU clock is off (NVIC, SysTick, etc.). It is recommended only to enable the modules that must work, and close the module after the module works.
- Stop mode: In this mode, the contents of SRAM and registers are maintained, HSI and HSE are turned off, and most modules of clocks in the VDD domain are stopped. GPIO, PVD, COMP output, RTC and LPTIM can wake up stop mode.

2.6. Reset

Two resets are designed in the chip: power reset and system reset.

2.6.1. Power reset

A power reset occurs in the following situations:

- Power-on/power-down reset (POR/PDR)
- Brown-out Reset (BOR)

2.6.2. System reset

A system reset occurs when the following events occur:

- Reset of NRST pin
- Windowed watchdog reset (WWDG)
- Independent watchdog reset (IWDG)
- SYSRESETREQ software reset
- Option byte load reset (OBL)
- Power reset (POR/PDR, BOR)

2.7. General-purpose inputs and outputs (GPIOs)

Each of the GPIO pins can be configured by software as output (push-pull or open-drain), as input (with or without pull-up or pull-down) or as peripheral alternate function, locking mechanism will freeze I/Os configuration function .

2.8. Hardware divider (DIV)

Hardware divider is a 32-bit signed/unsigned integer hardware divider.

DIV fature:

- Configurable signed/unsigned integer division calculation
- 32-bit dividend, 32-bit divisor

- Output 32-bit quotient and 32-bit remainder
- Division zero warning flag, division end flag
- 8 clock cycles to complete a division operation
- Write the divisor register to trigger the division operation to start
- Automatically wait for the end of the calculation when reading the quotient register/remainder register

2.9. Direct memory access controller (DMA)

Direct memory access (DMA) is used to provide high-speed data transfer between peripherals and memory or between memory and memory. Data can be moved quickly through DMA without CPU intervention, which saves CPU resources for other operations. The DMA controller has seven channels, each dedicated to managing requests for memory access from one or more peripherals. There is also a mediator to coordinate the priority of individual DMA requests.

The main functions are as follows:

- Single AHB Master
- Support peripherals to memory, the memory to the peripherals, memory to memory and peripherals to peripheral data transmission
- On-chip memory devices, such as Flash, an SRAM, AHB and APB peripherals, as the source and target
- All DMA channel can be independent configuration:
 - Each channel is associated either with a DMA request signal from a peripheral or with a software trigger in a memory-to-memory transfer. This configuration is done by software.
 - The priority between requests is programmable by software (4 levels per channel: very high, high, medium, low) and, in equal cases, by hardware (such as a request for channel 1 taking precedence over a request for channel 2).
 - The transfer sizes of the source and destination are independent (byte, half word, word), simulating packing and unpacking. The source and destination addresses must be aligned by data size.
 - Programmable data transmission: 0 ~ 65535
- Each channel generates an interrupt request. Each interrupt request is caused by one of three DMA events: transfer completion, half-transfer, or transfer error.

2.10. Interrupts and events

The PY32F072 handles exceptions through the Cortex-M0+ processor's embedded a nested vectored interrupt controller (NVIC) and an extended interrupt/event controller (EXTI).

2.10.1. Nested vectored interrupt controller (NVIC)

NVIC is a tightly coupled IP inside the Cortex-M0+ processor. The NVIC can handle NMI (Non-Maskable Interrupts) and maskable external interrupts from outside the processor and Cortex-M0+ internal exceptions. NVIC provides flexible priority management.

The tight coupling of the processor core to the NVIC greatly reduces the delay between an interrupt event and the initiation of the corresponding interrupt service routine (ISR). The ISR vectors are listed in a vector table, stored at a base address of the NVIC. The vector table base address determines the vector address of the ISR to execute, and the ISR is used as the offset composed of serial numbers.

If a high-priority interrupt event occurs and a low-priority interrupt event is just waiting to be serviced, the later-arriving high-priority interrupt event will be serviced first. Another optimization is called tail-chaining. When returning from a high-priority ISR and then starting a pending low-priority ISR, unnecessary pushes and pops of processor contexts will be skipped. This reduces latency and improves power efficiency.

NVIC features:

- Low latency interrupt handling
- Level 4 interrupt priority
- Supports one NMI interrupt
- Support 32 maskable external interrupts
- Supports 10 Cortex-M0+ exceptions
- High-priority interrupts can interrupt low-priority interrupt responses
- Support tail-chaining optimization
- Hardware interrupt vector retrieval

2.10.2. Extended interrupt/event controller (EXTI)

EXTI adds flexibility to handle physical wire events and generates wake-up events when the processor wakes up from stop mode.

The EXTI controller has multiple channels, including a maximum of 16 GPIOs, 1 PVD output, 3 COMP outputs, RTC and LPTIM wake-up signals. GPIO, PVD and COMP can be configured to be triggered by a rising edge, falling edge or double edge. Any GPIO signal can be configured as EXTI0 to 15 channel through the select signal.

- Each EXTI line can be independently masked through registers.
- The EXTI controller can capture pulses shorter than the internal clock period.
- Registers in the EXTI controller latch each event. Even in stop mode, after the processor wakes up from stop mode, it can identify the wake-up source or identify the GPIO and event that caused the interrupt.

2.11. Analog-to-digital converter (ADC)

The chip has a 12-bit SAR-ADC. The module supports up to 24 conversion channels, including 16 external channels and 8 internal channels. The reference voltage can be selected with precision voltage (2.14 V、2.66 V) or the power supply voltage.

The internal channels are: T_{S_VIN} , V_{REFINT} , $V_{CCA}/3$, OPA 1~3, DAC 1~2.

- The conversion mode of each channel can be set to single, continuous, sweep, discontinuous mode. Conversion results are stored in left or right-aligned 16-bit data registers.
- An analogue watchdog allows the application to detect if the input voltage exceeds a user-defined high or low threshold.
- The ADC has been implemented to operate at a low frequency, resulting in lower power consumption.
- At the end of sampling, conversion, and continuous conversion, an interrupt request is generated when the conversion voltage exceeds the threshold when simulating the watchdog.

2.12. Digital-to-analog converter (DAC)

Digital/analog conversion module (DAC) is a 12-bit digital input, voltage output digital/analog converter. The DAC can be configured in 8-bit or 12-bit mode, or can be used in conjunction with a DMA controller. When the DAC is operating in 12-bit mode, the data can be left justified or right justified. The DAC module has two output channels, each with a separate converter. In dual-DAC mode, the two channels can be converted independently, or they can be converted simultaneously and update the output of the two channels synchronously. The main features are as follows:

- 12 mode data left or right aligned
- synchronous update functionality
- waveform generating noise
- triangle waveform generation
- dual DAC channel or respectively at the same time
- each channel has the DMA function
- support DMA underflow error detection
- external triggers the transformation

2.13. Comparators (COMP)

Three general purpose comparators are integrated in the chip, namely COMP1/2/3. It can be used as a separate module or in combination with timer.

Comparators can be used as follows:

- Triggered by analog signal to generate low-power mode wake-up function
- Analog signal conditioning
- Cycle by cycle current control loop when connected with PWM output from timer

2.14. Operational amplifier (OPA)

The OPA1/2/3 module can be flexibly configured and is suitable for simple amplifiers. The three internal opamps can be cascaded using external resistors.

OPA features are summarized as follows:

- Three independently configured operational amps
- OPA input range is 0 to V_{CCA} , output range is 0.1 V to $V_{CCA} - 0.2$ V (demand) to simulate a module, a programmable gain
- Can be configured for the following models
- General operational mode (general purpose OPA)
- DAC voltage follower

2.15. Hardware divider (DIV)

Hardware divider is a 32-bit signed/unsigned integer hardware divider.

DIV features:

- Support 32-bit division
- The data in the register cannot be changed while the current division is not finished
- Configurable signed/unsigned integer division calculation
- 32-bit divisor, 32-bit divisor
- Outputs 32-bit quotient and 32-bit remainder
- Divide-by-zero warning flag bit, end-of-division flag bit
- 8 clock cycles to complete a division operation
- Write the divisor register to trigger the start of the divide operation
- After writing the divisor, when reading the quotient and remainder registers, you need to wait for the completion flag DIV-END
- When the divisor is 0, the result of quotient and remainder is 0

2.16. Liquid crystal display (LCD) controller

The LCD controller is a digital controller/driver for monochrome passive liquid crystal displays (LCDS), with up to 8 common terminals (COM) and 40 segment terminals (SEG) to drive 160 (4 * 40) or 288 (8 * 36) LCD image elements. The exact number of terminals depends on the device pins described in the data manual. LCD functions are summarized as follows:

- Highly flexible frame rate control
- Support static, 1/2, 1/3, 1/4, 1/6, and 1/8 of a duty ratio
- Support 1/2, 1/3 bias voltage
- Up to 16 registers LCD data RAM
- By software configuration of LCD contrast

- 3 kinds of waveform generation
 - internal resistance pressure resistance, external pressure, external capacitance partial pressure
 - by way of internal resistance of the software configuration partial pressure power consumption, so as to match the capacitance charge needed for the LCD panel
- Support low power consumption modes: LCD controller can be on the Run, Sleep and Stop mode for display
- Configurable frame interrupt
- Support LCD flashing function and configuration of multiple flicker frequency
- Unused LCD segments and public pin can be configured to digital or analog functions

2.17. Timer

The characteristics of different timers of PY32F072 series are shown in the following table:

Table 2-3 Timer features comparsion

Timer type	Timer	Counter resolution	Counter type	Prescaler factor	DMA	Capture /compare channels	Complementary outputs
Advanced control	TIM1	16-bit	Up, down, center aligned	Integer from 1 to 65536	Support	4	3
General purpose	TIM2	32-bit	Up, down, center aligned	Integer from 1 to 65536	Support	4	-
General purpose	TIM3	16-bit	Up, down, center aligned	Integer from 1 to 65536	Support	4	-
	TIM14	16-bit	Up	Integer from 1 to 65536	-	1	-
	TIM15	16-bit	Up	Integer from 1 to 65536	-	2	1
	TIM16, TIM17	16-bit	Up	Integer from 1 to 65536	Support	1	1
Basic	TIM6, TIM7	16-bit	Up	Integer from 1 to 65536	Support	-	-

2.17.1. Advanced-control timer (TIM1)

The advanced-control timer (TIM1) is consist of a 16-bit auto-reload counter driven by a programmable prescaler. It can be used in various scenarios, including pulse length measurement of input signals (input capture) or generating output waveforms (output compare, output PWM, complementary PWM with dead-time insertion).

TIM1 includes 4 independent channels:

- Input capture
- Output comparison
- PWM generation (edge or center-aligned mode)
- Single pulse mode output

If TIM1 is configured as a standard 16-bit timer, it has the same features as the TIMx timer. If configured as the 16-bit PWM generator, it has full modulation capability (0-100%).

The counter can be frozen in debug mode.

Many features are shared with those of the standard timers which have the same architecture. The advanced control timer can therefore work together with the other timers by the Timer Link feature for synchronization or event chaining.

TIM1 supports the DMA function.

2.17.2. General-purpose timers

2.17.2.1. TIM2/TIM3

The general-purpose timers TIM2/TIM3 are consist of 32/16-bit auto-reload counters and a 32/16-bit prescaler. There are four independent channels each for input capture/output compare, PWM or one-pulse mode output.

- They can work with the TIM1 by the Timer Link.
- TIM2/TIM3 supports DMA function.
- This timer is capable of handling quadrature (incremental) encoder signals and the digital outputs from 1 to 3 hall-effect sensors.
- The counter can be frozen in debug mode.

2.17.2.2. TIM14

- The general-purpose timer (TIM14) is consist of a 16-bit auto-reload counter driven by a programmable prescaler.
- TIM14 features one single channel for input capture/output compare, PWM or one-pulse mode output.
- The counter can be frozen in debug mode.

2.17.2.3. TIM15/TIM16/TIM17

- The general-purpose timer (TIM15, TIM16 and TIM17) is consist of a 16-bit auto-reload counter driven by a programmable prescaler.
- TIM16/TIM17 features one single channel for input capture/output compare, PWM or one-pulse mode output.
- TIM15 features two single channel for input capture/output compare, PWM or one-pulse mode output.
- TIM15/TIM16/TIM17 have complementary outputs with dead time.
- TIM15/TIM16/TIM17 supports DMA function.
- The counter can be frozen in debug mode.

2.17.3. Basic timers (TIM6/TIM7)

- The basic timer (TIM6/TIM7) is consist of a 16-bit auto-reload upcounter driven by their programmable prescaler respectively.
- Synchronization circuit to trigger DAC.
- Generate interrupt/DMA request on update event (counter overflow).

2.17.4. Low power timer (LPTIM)

- LPTIM is a 16 -bit upcounter with a 3-bit prescaler and only support a single count.
- LPTIM can be configured as a stop mode wake-up source.
- The counter can be frozen in debug mode.

2.17.5. Independent watchdog (IWDG)

Independent watchdog (IWDG) is integrated in the chip, and this module has the characteristics of high-security level, accurate timing and flexible use. IWDG finds and resolves functional confusion due to software failure and triggers a system reset when the counter reaches the specified timeout value.

- The IWDG is clocked by LSI, so even if the main clock fails, it can keep working.
- IWDG is the best suited for applications that require the watchdog as a standalone process outside of the main application and do not have high timing accuracy constraints.
- Controlling of option byte can enable IWDG hardware mode.
- IWDG is the wake-up source of stop mode, which wakes up stop mode by reset.
- The counter can be frozen in debug mode.

2.17.6. System window watchdog (WWDG)

The system window watchdog is based on a 7-bit downcounter that can be set as free running. It can be used as a watchdog to reset the device when a problem occurs. It is clocked from the APB clock (PCLK). It has an early warning interrupt capability, and the counter can be frozen in debug mode.

2.17.7. SysTick timer

SysTick timer is dedicated to real-time operating systems, but could also be used as a standard downcounter.

SysTick Features:

- 24-bit down counter
- Auto-reload capability
- Maskable system interrupt generation when the counter reaches 0

2.18. Real-time clock (RTC)

The real-time clock is an independent counter. It has a set of continuous counting counters, which can provide a clock calendar function under the corresponding software configuration. Modifying the value of the counter can reset the current time and date of the system.

- RTC is a 32-bit programmable counter with a prescale factor of up to 2^{20} bits.
- The RTC counter clock source can be LSE/LSI and the stop wake-up source.
- RTC can generate alarm interrupt, second interrupt and overflow interrupt (maskable).
- RTC supports clock calibration.
- RTC can be frozen in debug mode.

2.19. Cyclic redundancy check cell(CRC)

CRC computing unit is based on a fixed generation polynomial to obtain 32-bit CRC computing results. In other applications, CRC technology is mainly used to verify the correctness and integrity of data transmission or data storage. CRC cell contains one 32-bit data register:

- When writing to this register, as an input register, you can enter new data to perform CRC calculations.
- When the register is read, the result of the last CRC calculation is returned.
- Each time a data register is written, the result of the calculation is a combination of the previous CRC calculation and the new calculation (CRC calculation is performed on the entire 32-bit word rather than byte by byte).
- You can RESET register CRC_DR to 0xFFFF by setting the reset bit of register CRC_CR. This operation does not affect the data in register CRC_IDR.
- The initial CRC value can be configured.

2.20. Clock check system (CTC)

The clock calibration controller (CTC) uses hardware to automatically calibrate the RC crystal oscillator (HSI) when the internal configuration is 16 MHz, and uses the PLL (48 M) after 3 times the frequency as the clock source of the USBD module. The CTC module calibrates the HSI clock frequency based on an external high-precision reference signal source, and adjusts the calibration value automatically or manually to obtain an accurate PLL48 M clock.

The CTC module performs the following functions:

- Three external reference sources: GPIO, LSE clock,USBD_SOF.
- Provide software reference synchronization pulse.
- Hardware calibration automatically, no software operation.
- 16 bits calibration counter with reference source capture and overload capabilities.
- 8 bits clock calibration base value for frequency evaluation and automatic calibration.

- Flag bits and interrupts that indicate the state of clock calibration: calibration success state (CKOKIF), Warning state (CKWARNIF), and error state (ERRIF).

2.21. System configuration controller (SYSCFG)

The SYSCFG module provides the following functions:

- The filtering function on the IO pin of the _I²C type was enabled or disabled
- Enable or disable filtering on all I/O pins
- Remap trigger sources for some Dmas to different DMA channels
- Remap memory at the beginning of the code interval (Boot)
- Manages the TIMERS ETR or brake input

2.22. Debug support (DBG)

The MCU DBG module assists the debugger with the following functions:

- Support sleep mode, stop mode and standby mode
- When the CPU enters the HALT mode, the control timer or watchdog stops counting or continues counting
- Block I²C1 and I²C2 SMBUS timeouts when the CPU is in HALT mode
- Block CAN's receive register from updating allocation tracking pins when the CPU enters HALT
- The MCUDBG register also provides chip ID encoding. This ID encoding can be accessed by a JTAG or SW debug interface, or by a user program.

2.23. Inter-integrated circuit interface (I²C)

I²C (inter-integrated circuit) bus interface connects the microcontroller and the serial I²C bus. It provides multi-master capability and controls all I²C bus specific sequences, protocols, arbitration and timing. Standard mode (Sm) and fast mode (Fm) are supported.

I²C Features:

- Two I²C Interface, support Slave and Master mode
- Multi-host function : can be Master or Slave
- Support different communication speeds
 - Standard Mode (Sm): Up to 100 kHz
 - Fast Mode (Fm): up to 400 kHz
- As Master
 - Generate Clock
 - Generation of Start and Stop
- As Slave
 - Programmable I²C address detection
 - Dual-address capability that responds to two secondary addresses
 - Discovery of the Stop bit

- 7-bit/10-bit addressing mode
- General call
- Status flag
 - Transmit/receive mode flags
 - Byte transfer complete flag
 - I²C busy flag bit
- Error flag
 - Master arbitration loss
 - ACK failure after address/data transfer
 - Start/Stop error
 - Overrun/Underrun (clock stretching function disable)
- Optional clock stretching
- Single-byte buffer with DMA capability
- Software reset
- Analog noise filter function
- Support SMBus

2.24. Universal synchronous/asynchronous receiver transmitter (USART)

PY32F072 contains 4 USARTs, supports ISO7816, LIN, IrDA.

The USARTs provide a flexible method for full-duplex data exchange with external devices using the industry-standard NRZ asynchronous serial data format. The USART utilizes a fractional baudrate generator to provide a wide range of baudrate options.

It supports simultaneous one-way communication and half-duplex single-wire communication, and it also allows multi-processor communication.

Automatic baudrate detection is supported.

High-speed data communication can be achieved by using the DMA method of the multi-buffer configuration.

USARTs features:

- Full-duplex asynchronous communication
- NRZ standard format
- Configurable 16 times or 8 times oversampling for increased flexibility in speed and clock tolerance
- Programmable baudrate shared by transmit and receive, up to 4.5 Mbit/s
- Automatic baudrate detection
- Programmable data length of 8 or 9 bits
- Configurable stop bits (0.5, 1, 1 or 2 bits)
- Synchronous mode and clock output function for synchronous communication
- Single-wire half-duplex communication

- Independent transmit and receive enable bits
- Hardware flow control
- Receive/transmit bytes by DMA buffer
- Detection flag
 - Receive full buffer
 - Send empty buffer
 - End of transmission
- Parity control
 - Send check digit
 - Check the received data
- Flagged interrupt sources
 - CTS change
 - Send empty register
 - Send completed
 - Receive full data register
 - Bus idle detected
 - Overflow error
 - Frame error
 - Noise operation
 - Error detection
- Multiprocessor communication
 - If the address does not match, enter silent mode
- Wake-up from silent mode: by idle detection and address flag detection

2.25. Serial peripheral interface (SPI)

PY32F072 contains two SPIs. SPIs allow the chip to communicate with external devices in half-duplex, full-duplex, and simplex synchronous serial communication. This interface can be configured in Master mode and provides the communication clock (SCK) for external slave devices. The interface can also work in a multi-master configuration.

The SPI features are as follows:

- Master or Slave mode
- 3-wire full-duplex simultaneous transmission
- 2-wire half-duplex synchronous transmission (with bidirectional data line)
- 2-wire simplex synchronous transmission (no bidirectional data line)
- 8-bit or 16-bit transmission frame selection
- Support multi-master mode
- 8 Master mode baud rate prescale factors (max $f_{PCLK}/2$)
- Slave mode frequency (max $f_{PCLK}/4$)
- Both Master and Slave modes can be managed by software or hardware NSS: dynamic change of Master/Slave operating mode

- Programmable clock polarity and phase
- Programmable data order, MSB first or LSB first
- Dedicated transmit and receive flags that can trigger interrupts
- SPI bus busy status flag
- Motorola mode
- Interrupt-causing Master mode faults, overloads
- Two 32-bit Rx and Tx FIFOs with DMA capability

2.26. USB2.0 full-speed module

PY32F072 contains 1 USB 2.0 full speed module. USB peripheral implements the interface between USB2.0 full speed bus and APB1 bus. Support USB suspend/restore operation, can stop the device clock to achieve low power consumption. The main features are as follows:

- Comply with the technical specifications of USB 2.0 full speed devices
- It can be configured with 1 to 6 USB endpoints
- CRC(cyclic redundancy check) generation/check, reverse non-return to zero (NRZI) encoding/decoding and bit filling
- Support control transmission/synchronous transmission/batch transmission/interrupt transmission
- Supports a dual buffer mechanism for batch/synchronous endpoints
- USB suspend and restore operations are supported
- Frame lock clock pulse generation
- Dedicated 1024-byte packet cache storage

2.27. CAN

PY32F072 contains one CAN communication interface module. The Controller Area Network (CAN) bus is a bus standard that can realize the communication between microprocessors or devices without a host.

The CAN bus controller CAN handle data sending and receiving on the bus. In this product, the CAN controller has 12 groups of filters. Filters are used to select messages for the application to receive. The application program in the CAN controller can Transmit 1 Primary Transmit Buffer (PTB) and 3 Secondary Transmit buffers (PTB) STB sends the sending data to the bus, and the sending scheduler determines the sending order of the mailboxes. The bus data is obtained through three Receive buffers (RB). Three STBS and three RB can be interpreted as two level 3 FIFO, where the FIFO is completely hardware controlled. The CAN bus controller also supports Time-trigger communication.

- Fully support ISO11898-1 CAN2.0A/ CAN2.0B protocol
- CAN2.0 supports a maximum communication baud rate of 1M bit/s
- The baud rate ranges from 1 to 1/256. The baud rate is flexibly configured
- Three receive buffers
 - FIFO mode

- Error or unreceived data does not overwrite stored messages
- One high - priority primary send buffer PTB
- Three sub-send buffers STB
 - FIFO mode
 - Priority arbitration mode
- 12 separate sets of filters
 - It supports 11-bit standard ID and 29-bit extended ID
 - Programmable ID CODE bit and MASK bit
- Silent mode support
- Supports loopback mode
- Supports capturing transmission error types and locating quorum failure locations
- Programmable error warning value
- Support ISO11898-4 time trigger CAN and receive time stamp

2.28. Serial wire debug (SWD)

The ARM SWD interface allows serial debugging tools to be connected to the PY32F072.

3. Pin Configuration

Table 3-1 Pin Definition Terminology and Symbols

Name	Symbol	Definition
Pin type	S	Supply pin
	G	Ground pin
	I	Input-only pin
	I/O	Input/output pin
I/O structure	COM	Normal 5V I/O with analog input and output function
	RST	Reset pin, with internal weak pull-up resistor, without analog input and output function
	COM_F	I/O, I ² C Fm+ capable with analog input and output function
	COM_U	GPIO 5V tolerant with USB PHY function

Name		Symbol	Definition		
Notes		-	Unless otherwise specified, all ports are used as floating inputs between and after reset		
Pin function	Alternate functions	-	Function selected by GPIOx_AFR register		
	Additional functions	-	Directly selected or enabled through peripheral registers

1. Configure by option bytes to choose PF2 or NRST.
2. After reset, PA13 and PA14 are configured as SWDIO and SWCLK AF functions, the former has an internal pull-up resistor and the latter has an internal pull-down resistor activated.
3. BOOT0 defaults to digital input mode and pull-down is enable.

1. In the above table, the reserved address cannot be written, read back is 0, and a hardfault is generated
2. Not only supports 32 bits word access, but also supports halfword and byte access.
3. Not only supports 32 bits word access, but also supports halfword access.

5. Electrical Characteristics

5.1. Parameter conditions

Unless otherwise specified, all voltages are referenced to V_{SS}.

5.1.1. Minimum and maximum values

Unless otherwise specified, the minimum and maximum values are guaranteed in the worst conditions of ambient temperature, supply voltage and frequencies by tests in production on 100% of the devices with an ambient temperature at T_A = 25°C and T_A = T_{A(max)} (given by the selected temperature range).

Data based on electrical characterization results, design simulations and/or technology characteristics are indicated in the table footnotes and are not tested in production. Based on characterization, the minimum and maximum values refer to sample tests and represent the mean value plus or minus three times the standard deviation.

5.1.2. Typical values

Unless otherwise specified, typical data is based on T_A = 25°C and V_{CC} = 3.3V. They are given only as design guidelines and are not tested.

Typical ADC accuracy values are determined by characterization of a batch of samples from a standard diffusion lot over the full temperature range, where 95% of the devices have an error less than equal to the value indicated.

5.2. Absolute maximum ratings

Stresses above the absolute maximum ratings listed in following tables may cause permanent damage to the device. These are stress ratings only and functional operation of the device at these conditions is not implied. Exposure to maximum rating conditions for extended periods may affect device reliability.

Table 5-1 Voltage characteristics ⁽¹⁾

Symbol	Ratings	Minimum	Maximum	Unit
V _{CC}	External mains power supply	-0.3	6.25	V
V _{IN}	Input voltage of other pins	-0.3	V _{CC} +0.3	V

- Power supply V_{CC} and ground V_{SS} pins must always be connected to the external power supply within the allowable range.

Table 5-2 Current characteristics

Symbol ⁽²⁾	Describe	Maximum	Unit
I _{VCC}	Flowing into V _{CC} pin (supply current) ⁽¹⁾	150	mA
I _{VSS}	Total current flowing out of V _{SS} pin (outflow current) ⁽¹⁾	150	
I _{IO(PIN)}	Output current sunk by any I/O and control pin	20	
	Output current source by any I/Os and control pin	-20	

1. Power supply V_{CC} and ground V_{SS} pins must always be connected to the external power supply within the allowable range.
2. These I/O types refer to the terms and symbols defined by pins.

Table 5-3 Thermal characteristics

Symbol	Describe	Condition	Value	Unit
T_{STG}	Storage temperature range		-65 to +150	°C
T_O	Range of operating temperature	x 6 version	-40 to +85	°C
		x 7 version	-40 to +105	

5.3. Operating conditions

5.3.1. General operating conditions

Table 5-4 General operating conditions

Symbol	Parameter	Condition	Minimum	Maximum	Unit
f_{HCLK}	Internal AHB clock frequency	-	0	72	MHz
f_{PCLK}	Internal APB Clock frequency	-	0	72	MHz
V_{CC}	Standard operating voltage	-	1.7	5.5	V
V_{CCA}	Operating voltage of analog circuit	Must be the same as V_{CC}	1.7	5.5	V
V_{IN}	I/O input voltage	-	-0.3	$V_{CC}+0.3$	V
T_A	Ambient temperature	-	-40	85	°C
		-	-40	105	
T_J	Junction temperature	-	-40	90	°C
		-	-40	110	

5.3.2. Operating conditions at power-up / power-down

Table 5-5 Operating conditions at power-up / power-down

Symbol	Parameter	Condition	Minimum	Maximum	Unit
tvcc	V_{CC} rise time rate	-	0	∞	us/V
	V_{CC} fall time rate	-	20	∞	

5.3.3. Embedded reset and PVD module features

Table 5-6 Embedded reset module features

Symbol	Parameter	Condition	Minimum	Typical	Maximum	Unit
V _{PVD}	Programmable voltage detector level selection	PLS[2:0]=000 (Rising edge)	1.7	1.8	1.9	V
		PLS[2:0]=000 (Falling edge)	1.6	1.7	1.8	V
		PLS[2:0]=001 (Rising edge)	1.9	2	2.1	V
		PLS[2:0]=001 (Falling edge)	1.8	1.9	2	V

				IWDG	5.30	84.1	-	-	
			OFF	LPTIM	5.30	83.7	-	-	
				RTC	5.20	84.0	-	-	
				No	5.00	83.9	-	-	

1. Data is based on assessment results and is not tested in production.

5.3.5. Wakeup time from low-power modes

Table 5-10 Wakeup time from low-power modes

Symbol	Parameters ⁽¹⁾		Condition	Typical ⁽²⁾	Maximum	Unit
tWUSLEEP	Wake-up from sleep mode		-	7	-	CPU Cycles
tWUSTOP	Wake-up from stop mode	Powered by MR	Execute program in Flash, HSI (24 MHz) as system clock	3.5	-	us
		Powered by LPR	Execute program in Flash, HSI (24 MHz) as system clock	7	-	

1. The wake-up time is measured from the wake-up time until the first instruction is read by the user program.
 2. Data is based on assessment results and is not tested in production.

5.3.6. External clock source characteristics

5.3.6.1. External high-speed clock

In bypass mode of HSE (the HSEBYP of RCC_CR is set), when the high-speed start-up circuit in the chip stops working, the corresponding I/O is used as a standard GPIO.

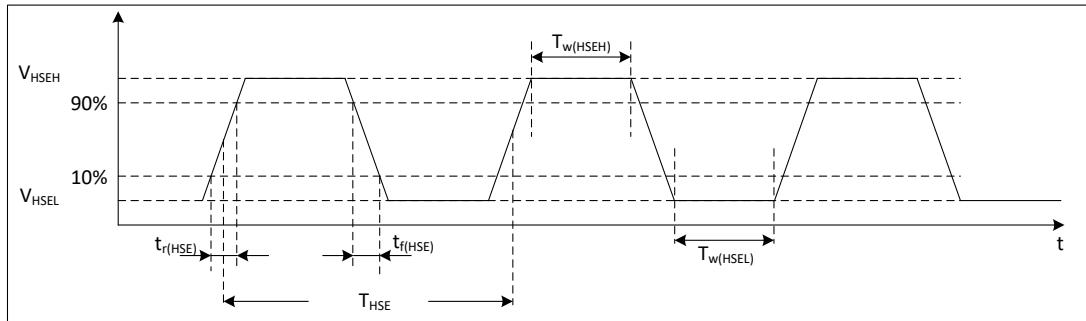

Figure 5-1 External high-speed clock timing diagram

Table 5-11 External high-speed clock features

Symbol	Parameters ⁽¹⁾	Minimum	Typical	Maximum	Unit
f_{HSE_ext}	User external clock source frequency	1	8	32	MHz
V_{HSEH}	Input pin high level voltage	$0.7V_{CC}$	-	V_{CC}	V
V_{HSEL}	Input pin low level voltage	V_{SS}	-	$0.3V_{CC}$	
$t_w(HSEH)$ $t_w(HSEL)$	Enter high or low time	15	-	-	ns
$t_r(HSE)$ $t_f(HSE)$	Enter the rise/fall time	-	-	20	ns

1. Guaranteed by design, not tested in production.

5.3.6.2. External low-speed clock

In the bypass mode of LSE (the LSE_BYP of RCC_BDCR is set), the low-speed start-up circuit in the chip stops working, and the corresponding I/O is used as a standard GPIO.

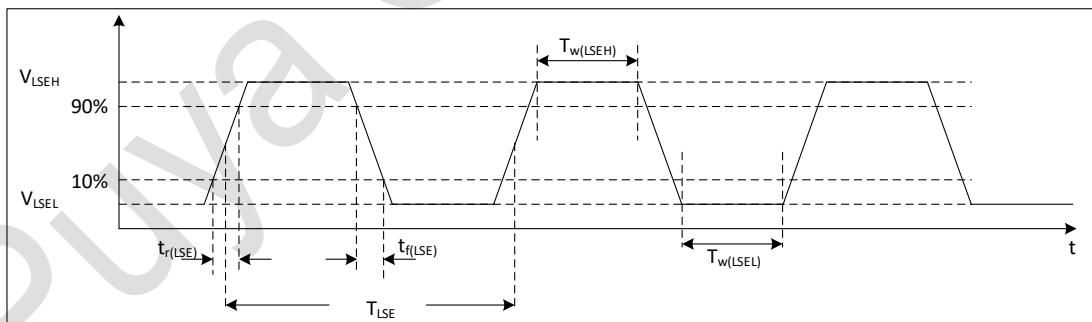

Figure 5-2 External low-speed clock timing diagram

Table 5-12 External low-speed clock characteristics

Symbol	Parameters ⁽¹⁾	Minimum	Typical	Maximum	Unit
f_{LSE_ext}	User external clock frequency	-	32.768	1000	kHz
V_{LSEH}	Input pin high level voltage	$0.7V_{CC}$	-	-	V
V_{LSEL}	Input pin low level voltage	-	-	$0.3V_{CC}$	V
$t_w(LSEH)$ $t_w(LSEL)$	Enter high or low time	450	-	-	ns

$t_r(LSE)$ $t_f(LSE)$	Enter the rise/fall time	-	-	50	ns
--------------------------	--------------------------	---	---	----	----

- Guaranteed by design, not tested in production .

5.3.6.3. External high-speed crystal

The high-speed external (HSE) clock can be supplied with 4 ~ 32 MHz crystal/ceramic resonator oscillator. In the application, the resonator and the load capacitors have to be placed as close as possible to the oscillator pins in order to minimize output distortion and startup stabilization time.

Table 5-13 External high-speed crystal characteristics

Symbol	Parameter	Condition ⁽¹⁾	Minimum ⁽²⁾	Typical	Maximum ⁽²⁾	Unit	
f_{osc_IN}	Oscillation frequency	-	4	-	32	MHz	
$I_{DD}^{(4)}$		During startup	-	-	5.5	mA	
		$V_{CC}=3\text{ V}, R_m=30\ \Omega, C_L=10\text{ pF}@8\text{ MHz}$ $HSE_DRV[1:0]=01$	-	0.58	-		
		$V_{CC}=3\text{ V}, R_m=30\ \Omega, C_L=5\text{ pF}@16\text{ MHz}$ $HSE_DRV[1:0]=10$	-	0.89	-		
		$V_{CC}=3\text{ V}, R_m=30\ \Omega, C_L=10\text{ pF}@24\text{ MHz}$ $HSE_DRV[1:0]=10/11$	-	1.14	-		
		$V_{CC}=3\text{ V}, R_m=30\ \Omega, C_L=20\text{ pF}@32\text{ MHz}$ $HSE_DRV[1:0]=11$	-	1.94	-		
$t_{SU(HSE)}^{(3)(4)}$	Startup Time	$f_{osc_IN}=32\text{ MHz}$ $HSE_STARTUP[1:0]=00$ $HSE_DRV[1:0]=11$	-	2	-	ms	
		$f_{osc_IN}=4\text{ MHz}$ $HSE_STARTUP[1:0]=00$ $HSE_DRV[1:0]=11$	-	2	-		

- Crystal/ceramic resonator characteristics are based on the manufacturer's datasheet.
- Guaranteed by design, not tested in production.
- $t_{SU(HSE)}$ is the startup time from enable (by software) to when the clock oscillation reaches a stable state , measured for a standard crystal/resonator, which can vary considerably from one crystal/resonator to another .
- Data is based on assessment results and is not tested in production.

5.3.6.4. External low speed crystal

The low-speed external (LSE) clock can be supplied with a 32.768 KHz crystal resonator oscillator. In the application, the resonator and the load capacitors have to be placed as close as possible to the oscillator pins in order to minimize output distortion and startup stabilization time.

Table 5-14 External low-speed crystal feature

Symbol	Parameter	Condition ⁽¹⁾	Minimum ⁽²⁾	Typical	Maximum ⁽²⁾	Unit
$I_{DD}^{(4)}$	LSE current consumption	LSE_DRIVER [1:0] = 00	-	250	-	nA
		LSE_DRIVER [1:0] = 01	-	560	-	
		LSE_DRIVER [1:0] = 10	-	920	-	
		LSE_DRIVER[1:0] = 11	-	1260	-	
$t_{SU(LSE)}^{(3)(4)}$	Startup Time	-	-	3	-	s

1. Crystal/ceramic resonator characteristics are based on the manufacturer's datasheet.
2. Guaranteed by design, not tested in production.
3. $t_{SU(LSE)}$ is the startup time from enable (by software) to when the clock oscillation reaches a stable , measured for a standard crystal/resonator , which may vary greatly from crystal to resonator.
4. Data is based on assessment results and is not tested in production.

5.3.7. Internal high frequency clock source HSI characteristics

Table 5-15 Internal high frequency clock source characteristics

Symbol	Parameter	Condition	Minimum	Typical	Maximum	Unit
f_{HSI}	HSI frequency	-	-	4.0 8.0 16.0 22.12 24.0	-	MHz
$\Delta T_{emp(HSI)}$	HSI frequency temperature drift	$V_{CC} = 1.7 \text{ to } 5.5 \text{ V},$ $T_A = 25^\circ\text{C}$	-1 ⁽²⁾	-	1 ⁽²⁾	%
		$V_{CC} = 1.7 \text{ to } 5.5 \text{ V},$ $T_A = 0 \text{ to } 85^\circ\text{C}$	-2 ⁽²⁾	-	2 ⁽²⁾	
		$V_{CC} = 1.7 \text{ to } 5.5 \text{ V},$ $T_A = -40 \text{ to } 85^\circ\text{C}$	-4 ⁽²⁾	-	2 ⁽²⁾	
		$V_{CC} = 1.7 \text{ to } 5.5 \text{ V},$ $T_A = -40 \text{ to } 105^\circ\text{C}$	-4 ⁽²⁾	-	4 ⁽²⁾	
$f_{TRIM}^{(1)}$	HSI fine-tuning accuracy	-	-	0.1	-	%
$\Delta T_{emp(HSI)}$	HSI frequency temperature drift	-	45 ⁽¹⁾	-	55 ⁽¹⁾	%
$t_{Stab(HSI)}$	HSI stabilization time	-	-	2	4 ⁽¹⁾	us
$f_{TRIM}^{(1)}$	HSI fine-tuning accuracy	4 MHz	-	110	-	uA
		8 MHz	-	120	-	
		16 MHz	-	170	-	
		22.12 MHz, 24 MHz	-	210	-	

1. Guaranteed by design, not tested in production.
2. Data is based on assessment results and is not tested in production.

5.3.8. Internal low frequency clock source LSI characteristics

Table 5-16 Internal low frequency clock characteristics

Symbol	Parameter	Condition	Minimum	Typical	Maximum	Unit
f_{LSI}	LSI frequency	-	-	32.768	-	KHz
$\Delta T_{\text{temp}(LSI)}$	LSI frequency temperature drift	$V_{CC} = 3.3 \text{ V}$, $T_A = 25 \text{ }^\circ\text{C}$	-3	-	+3	%
		$V_{CC} = 1.7 \text{ to } 5.5 \text{ V}$, $T_A = 0 \text{ to } 85 \text{ }^\circ\text{C}$	-10 ⁽²⁾	-	10 ⁽²⁾	
		$V_{CC} = 1.7 \sim 5.5 \text{ V}$, $T_A = 0 \sim 105 \text{ }^\circ\text{C}$	-15 ⁽²⁾	-	15 ⁽²⁾	
		$V_{CC} = 1.7 \sim 5.5 \text{ V}$, $T_A = -40 \text{ to } 105 \text{ }^\circ\text{C}$	-20 ⁽²⁾	-	20 ⁽²⁾	
$f_{TRIM}^{(1)}$	LSI fine-tuning accuracy	-	-	0.2	-	%
$t_{\text{Stab}(LSI)}^{(1)}$	LSI stabilization time	-	-	150	-	us
$I_{DD(LSI)}^{(1)}$	LSI current consumption	-	-	210	-	nA

1. Guaranteed by design, not tested in production.
2. Data is based on assessment results and is not tested in production.

5.3.9. Phase locked loop (PLL) characteristics

Table 5-17 Phase locked loop characteristics

Symbol	Parameter	Condition	Minimum	Typical	Maximum	Unit
f_{PLL_IN}	Input frequency	$T_A = 25 \text{ }^\circ\text{C}$, $V_{CC} = 3.3 \text{ V}$ PLL * 2	16 ⁽¹⁾	-	24 ⁽¹⁾	MHz
		$T_A = 25 \text{ }^\circ\text{C}$, $V_{CC} = 3.3 \text{ V}$ PLL * 3	22.12 ⁽¹⁾	-	24 ⁽¹⁾	
f_{PLL_OUT}	Output frequency	$T_A = 25 \text{ }^\circ\text{C}$, $V_{CC} = 3.3 \text{ V}$	32 ⁽¹⁾	-	72	MHz
Jitter	Period jitter	-	-	-	0.3 ⁽¹⁾	ns
t_{LOCK}	Latch time	$f_{PLL_IN} = 24 \text{ MHz}$	-	15	40 ⁽¹⁾	us

1. Guaranteed by design, not tested in production.

5.3.10. Memory characteristics

Table 5-18 Memory characteristics

Symbol	Parameter	Condition	Typical	Maximum ⁽¹⁾	Unit
t_{prog}	Page program	-	1.0	1.5	ms
t_{ERASE}	Page/sector/mass erase	-	3.0	4.5	ms
I_{DD}	Page program	-	2.1	2.9	mA
	Page/sector/mass erase	-	2.1	2.9	mA

1. Guaranteed by design, not tested in production.

Table 5-19 Memory erase times and data retention

Symbol	Parameter	Condition	Minimum ⁽¹⁾	Unit
N_{END}	Erase and write times	$T_A = -40 \sim 85 \text{ }^\circ\text{C}$	100	kcycle

		$T_A = 85 \sim 105^\circ C$	10	
t_{RET}	Data retention period	10 Kcycle $T_A = 55^\circ C$	20	Year

1. Data is based on assessment results and is not tested in production.

5.3.11. EFT characteristics

Table 5-20 EFT characteristics

Symbol	Parameter	Condition	Grade	Typical	Unit
EFT to Power	-	IEC61000-4-4	A	A	kV

5.3.12. ESD & LU characteristics

Table 5-21ESD & LU characteristics

Symbol	Parameter	Condition	Typical	Unit
$V_{ESD(HBM)}$	Static discharge voltage (human body model)	ESDA/JEDEC JS-001-2017	6	kV
$V_{ESD(CDM)}$	Static discharge voltage (charging equipment model)	ESDA/JEDEC JS-002-2018	1	kV
$V_{ESD(MM)}$	Static discharge voltage (machine model)	JESD22-A115C	200	V
LU	Static latch-up	JESD78E	200	mA

5.3.13. Port characteristics

Table 5-22 IO static characteristics

Symbol	Parameter	Condition	Minimum	Typical	Maximum	Unit
V_{IH}	Input high level voltage	$V_{CC} = 1.7 \text{ to } 5.5 \text{ V}$	$0.7V_{CC}$	-	-	V
V_{IL}	Input low level voltage	$V_{CC} = 1.7 \text{ to } 5.5 \text{ V}$	-	-	$0.3V_{CC}$	V
$V_{hys}^{(1)}$	Schmitt hysteresis voltage	-	-	200		mV
I_{lkg}	Input leakage current	-	-	-	1	uA
R_{PU}	Pull-up resistor	-	30	50	70	kΩ
R_{PD}	Pull-down resistor	-	30	50	70	kΩ
$C_{IO}^{(1)}$	Pin capacitance	-	-	5	-	pF

1. Guaranteed by design, not tested in production.

Table 5-23 Output voltage characteristics

Symbol	Parameters ⁽¹⁾	Condition		Minimum	Maximum	Unit
$V_{OL}^{(2)}$	COM IO output low level	GPIOx_OSPEED R=11	$I_{OL} = 8 \text{ mA}, V_{CC} \geq 2.7 \text{ V}$	-	0.4	V
			$I_{OL} = 4 \text{ mA}, V_{CC} = 1.8 \text{ V}$	-	0.5	
$V_{OH}^{(2)}$	COM IO output high level	GPIOx_OSPEED R=11	$I_{OH} = 8 \text{ mA}, V_{CC} \geq 2.7 \text{ V}$	$V_{CC} - 0.4$	-	V
			$I_{OH} = 4 \text{ mA}, V_{CC} = 1.8 \text{ V}$	$V_{CC} - 0.5$	-	

1. IO types can refer to the terms and symbols defined by the pins.
2. Data is based on assessment results and is not tested in production.

5.3.14. NRST pin characteristics

Table 5-24 NRST pin characteristics

Symbol	Parameter	Condition	Minimum	Typical	Maximum	Unit
V_{IH}	Input high level voltage	$V_{CC} = 1.7 \text{ to } 5.5 \text{ V}$	$0.7V_{CC}$	-	-	V
V_{IL}	Input low level voltage	$V_{CC} = 1.7 \text{ to } 5.5 \text{ V}$	-	-	$0.2V_{CC}$	V
$V_{hys}^{(1)}$	Schmitt hysteresis voltage	-	-	300	-	mV
I_{lkg}	Input leakage current	-	-	-	1	uA
$R_{PU}^{(1)}$	Pull-up resistor	-	30	50	70	kΩ
$R_{PD}^{(1)}$	Pull-down resistor	-	30	50	70	kΩ
C_{IO}	Pin capacitance	-	-	5	-	pF

1. Guaranteed by design, not tested in production.

5.3.15. ADC characteristics

Table 5-25 ADC characteristics

Symbol	Parameter	Condition	Minimum	Typical	Maximum	Unit
V_{CCA}	Analog supply voltage for ADC ON	-	2.0	-	5.5	V
I_{CCA}	Current consumption	@1 MSPS	-	0.4	-	mA
$C_{IN}^{(1)}$	Internal sample and hold capacitors	-	-	5	8	pF
f_{ADC}	Convert clock frequency	$V_{CCA}=2.0 \sim 2.3 \text{ V}$	0.8	4	$8^{(2)}$	MHz
		$V_{CCA}=2.3 \sim 5.5 \text{ V}$	0.8	8	$16^{(2)}$	MHz
$t_{samp}^{(1)}$	Sampling time	$f_{ADC}=16 \text{ MHz}$	0.219	-	14.97	us
		$V_{CCA}=2.0 \sim 5.5 \text{ V}$	3.5	-	239.5	$1/f_{ADC}$
$t_{samp_setup}^{(1)}$	Sampling setup time ($V_{REFINT}, V_{CCA}/3, OPA 1\sim 3, DAC 1\sim 2$)	-	15	-	-	μs
$t_{conv}^{(1)}$	Total conversion time	$V_{CCA}=2.0 \sim 5.5 \text{ V}$	-	12	-	$1/f_{ADC}$
$t_{eoc}^{(1)}$	Conversion end time	$V_{CCA}=2.0 \sim 5.5 \text{ V}$	-	0.5	-	$1/f_{ADC}$
$DNL^{(2)}$	Differential linearity error	-	-	± 1	$-1 \sim 1.5$	LSB
$INL^{(2)}$	Integral linearity error	-	-		± 3	LSB
Offset ⁽²⁾	Offset error	-	-	± 1.5	± 3	LSB

1. Guaranteed by design, not tested in production.
2. Data is based on assessment results and is not tested in production.

5.3.16. DAC characteristics

Table 5-26 DAC characteristics

Symbol	Parameter	Comments	Minimum	Typical	Maximum	Unit
V_{CCA}	Analog supply voltage for DAC ON	Buffer ON	2.2	-	5.5	V
		Buffer OFF	2.2	-	5.5	V
$R_{LOAD}^{(1)}$	Resistive load	V_{SSA} with buffer ON	5	-	-	kΩ
		V_{CCA} with buffer ON	15	-	-	kΩ
$R_o^{(1)}$	Impedance output	The minimum resistive load between DAC_VOUT and V_{SSA} to have a 1% accuracy is $1.5 \text{ M}\Omega$ (When the buffer is ON).	-	-	15	kΩ
$C_{LOAD}^{(1)}$	Capacitive load	Maximum capacitive load at DAC_OUT pin (When the buffer is ON).	-	-	50	pF
$DAC_OUT_{min}^{(1)}$	Lower DAC_OUT voltage	Buffer ON,it gives the maximum output excursion of the DAC.	0.2	-	-	V
$DAC_OUT_{max}^{(1)}$	Higher DAC_OUT voltage		-	-	$V_{CCA} - 0.2$	V
$DAC_OUT_{min}^{(1)}$	Lower DAC_OUT voltage	Buffer OFF,it gives the maximum output excursion of the DAC.	-	0.5	-	mV
$DAC_OUT_{max}^{(1)}$	Higher DAC_OUT voltage		-	-	$V_{CCA} - 10 \text{ mV}$	V
$I_{CCA}^{(1)}$	V_{CCA} consumption ⁽²⁾	With no load, middle code (0x800) on the inputs	-	-	600	μA
		With no load, worst code (0xF1C) at $V_{CCA} = 3.6 \text{ V}$ in terms of DC consumption on the inputs	-	-	700	
$DNL^{(2)}$	Differential linearity error	Given for the DAC in 10 bits configuration	-	-	±1	LSB
		Given for the DAC in 12 bits configuration	-	-	±3	
$INL^{(2)}$	Integral linearity error	Given for the DAC in 10 bits configuration	-	-	±1	LSB
		Given for the DAC in 12 bits configuration	-	-	±4	
$Offset^{(2)}$	offset error	Given for the DAC in 10 bits	-	-	±3	LSB
		Given for the DAC in 12 bits	-	-	±12	
$Gain_{error}^{(2)}$	Gain error	Given for the DAC in 12 bits configuration	-	-	±0.5	%
$t_{SETTLING}^{(2)}$	Settling time	$C_{LOAD} \leq 50 \text{ pF}$, $R_{LOAD} \geq 5 \text{ k}\Omega$ Full scale: for a 10 bits input code transition between the lowest and the highest input codes when DAC_OUT reaches final value ±1LSB	-	4	10	μs
$Update_{rate}^{(2)}$	Max frequency for a correct DAC_OUT change when small variation in the inputcode (from code i to i+1LSB)	$C_{LOAD} \leq 50 \text{ pF}$, $R_{LOAD} \geq 5 \text{ k}\Omega$	-	-	1	MS/s
$t_{WAKEUP}^{(2)}$	Wakeup time from off state	$C_{LOAD} \leq 50 \text{ pF}$, $R_{LOAD} \geq 5 \text{ k}\Omega$ Input code between lowest and highest possible ones.	-	6.5	10	μs
$P_{SRR+}^{(1)}$	Power supply rejection ratio (to V_{CCA}) (static DC measurement)	No R_{LOAD} , $C_{LOAD} = 50 \text{ pF}$	-	-67	-40	dB

- Guaranteed by design, not tested in production.
- Data is based on assessment results and is not tested in production.

5.3.17. Comparator characteristics

Table 5-27 Comparator characteristics⁽¹⁾

Symbol	Parameter	Condition		Minimum	Typical	Maximum	Unit
V_{IN}	Input voltage range	-		0	-	V_{CC}	V
V_{SC}	Scaler offset voltage	-		-	± 5	± 10	mV
$I_{CCA(SCALER)}$	Scaler static consumption	-		-	0.8	1	uA
t_{START_SCALER}	Scaler startup time	-		-	100	200	us
t_{START}	Startup time	High-speed mode		-	-	5	us
		Medium-speed mode		-	-	15	
t_D	Propagation delay	High-speed mode	200 mV step, 100 mV overdrive	-	40	70	ns
		Medium-speed mode		-	0.9	2.3	us
		High-speed mode	>200 mV step, 100 mV overdrive	-	-	85	ns
		Medium-speed mode		-	-	3.4	us
V_{offset}	Offset error	-		-	± 5	-	mV
V_{hys}	Hysteresis	No hysteresis		-	0	-	mV
		With hysteresis		-	20	-	
I_{CCA}	Consumption	High-speed mode	Static	-	250		uA
			With 50 KHz and ± 100 mv overdrive square signal	-	250	--	uA
		Medium-speed mode	Static	-	7	-	uA
			With 50 KHz and ± 100 mv overdrive square signal	-	8	-	uA

1. Guaranteed by design, not tested in production.

5.3.18. Operational amplifier characteristics

Table 5-28 Comparator characteristics

Symbol	Parameter	Condition	Minimum	Typical	Maximum	Unit
V_i	Input voltage	-	0	-	V_{CCA}	V
V_o	The output voltage	-	0.1	-	$V_{CC} - 0.2$	V
I_o	Output current	-	-	-	2.2	mA
R_L	load time	-	5	-	-	k Ω
t_{start}	initialization time	-	-	-	20	us
V_{io}	Input offset voltage	-	--	± 6	-	mV
PM	Phase margin	-	-	80	-	Deg
UGBW	unity gain width	-	-	10	-	MHz
SR	Slew rate	-	-	8	-	V/us

5.3.19. Temperature sensor characteristics

Table 5-29 Temperature sensor characteristics

Symbol	Parameter	Minimum	Typical	Maximum	Unit
T _L ⁽¹⁾	V _{TS} linearity with temperature	-	±1	±2	°C
Avg_Slope ⁽¹⁾	Average slope	2.3	2.5	2.7	mV/°C
V ₃₀	Voltage at 30 °C (±5 °C)	0.742	0.76	0.785	V
t _{START} ⁽¹⁾	Start up time entering in continuous mode	-	70	120	us
t _{s_setup} ⁽¹⁾	ADC sampling time when reading the temperature	15	-	-	us

1. Guaranteed by design, not tested in production.
2. Data is based on assessment results and is not tested in production.

5.3.20. LCD Controller Characteristics

Table 5-30 LCD Controller Characteristics

Symbol	Parameter	Condition	Minimum	Typical	Maximum	Unit
I _{LCD} ⁽¹⁾⁽³⁾	LCD supply current	External low drive resistive mode	-	0.6	-	µA
		Internal low drive resistive mode	-	4	-	
		Internal high drive resistive mode	-	10	-	
R _H ⁽²⁾	Low drive resistive	-	-	1080	-	kΩ
R _L ⁽²⁾	High drive resistive	-	-	360	-	
V _{LCDH}	LCD adjustable highest level voltage	-	-	V _{CCA}	-	V
V _{LCD3}	LCD highest level voltage	-	-	V _{LCDH}	-	
V _{LCD2}	LCD 2/3 level voltage	-	-	2/3 V _{LCDH}	-	
V _{LCD1}	LCD 1/3 level voltage	-	-	1/3 V _{LCDH}	-	
V _{LCD0}	LCD lowest level voltage	-	-	V _{SS}	-	
ΔV _{LCD} ⁽³⁾	LCD segment/common level voltage error	T _A = -40 ~ 105 °C	-	-	±50	mV

1. LCD enabled with V_{CCA}=3.3 V, 1/4 duty, 1/3 bias, scan frequency 256 Hz, all pixels active, no LCD connected.
2. Guaranteed by design, not tested in production.
3. Data is based on assessment results and is not tested in production.

5.3.21. Built-in reference voltage characteristics

Table 5-31 Built-in reference voltage (V_{REFBUF}) characteristics

Symbol	Parameter	Condition	Minimum	Typical	Maximum	Unit
V _{REFINT}	Internal reference voltage	-	1.17	1.2	1.23	V

Symbol	Parameter	Condition	Minimum	Typical	Maximum	Unit
$t_{start_VREFINT}$	Start time of V_{REFINT}	-	-	10	15	us
$T_{coeff_VREFINT}$	Temperature coefficient of V_{REFINT}	-	-	-	100 ⁽¹⁾	ppm/°C
I_{VCC}	Current consumption from V_{CC}	-	-	12	20	uA

1. Guaranteed by design, not tested in production.

5.3.22. ADC Built-in reference voltage characteristics

Table 5-32 ADC Built-in reference voltage (V_{REFBUF}) characteristics⁽¹⁾

Symbol	Parameter	Condition	Minimum	Typical	Maximum	Unit
$V_{REFBUF26}$	Internal 2.66 V reference voltage	$T_A=25\text{ }^{\circ}\text{C}$, $V_{CCA}=3.3\text{ V}$	3.63	2.66	2.69	V
$V_{REFBUF20}$	Internal 2.14 V reference voltage	$T_A=25\text{ }^{\circ}\text{C}$, $V_{CCA}=3.3\text{ V}$	2.12	2.14	2.16	V
$t_{start_VREFBUF}$	Start time of V_{REFBUF}	-	-	-	2	μs
$T_{coeff_VREFBUF}$	Temperature coefficient of V_{REFBUF}	$T_A=-40 \sim 105\text{ }^{\circ}\text{C}$	-	-	120	ppm/°C

1. Guaranteed by design, not tested in production.

5.3.23. Timer characteristics

Table 5-33 Timer characteristics

Symbol	Parameter	Condition	Minimum	Maximum	Unit
$t_{res(TIM)}$	Timer resolution time	-	1	-	$t_{TIMxCLK}$
		$f_{TIMxCLK} = 72\text{ MHz}$	13.889	-	ns
f_{EXT}	Timer external clock frequency on CH1 to CH4	-	-	$f_{TIMxCLK}/2$	MHz
		$f_{TIMxCLK} = 72\text{ MHz}$	-	24	
Res_{TIM}	Timer resolution	$TIM1/3/14/15/16/17$	-	16	Bit
$t_{COUNTER}$	16 bits counter clock period	-	1	65536	$t_{TIMxCLK}$
		$f_{TIMxCLK} = 72\text{ MHz}$	0.013889	913	us

Table 5-34LPTIM characteristics (clock selection LSI)

Prescaler	PRESC[2:0]	Minimum overflow	Maximum overflow	Unit
/1	0	0.0305	1998.848	ms
/2	1	0.0610	3997.696	
/4	2	0.1221	8001.9456	
/8	3	0.2441	15997.3376	
/16	4	0.4883	32001.2288	
/32	5	0.9766	64002.4576	
/64	6	1.9531	127998.3616	
/128	7	3.9063	256003.2768	

Table 5-35!WDG characteristics (clock selection LSI)

Prescaler	PR[2:0]	Minimum overflow	Maximum overflow	Unit
/4	0	0.122	499.712	ms
/8	1	0.244	999.424	
/16	2	0.488	1998.848	
/32	3	0.976	3997.696	
/64	4	1.952	7995.392	
/128	5	3.904	15990.784	
/256	6 or 7	7.808	31981.568	

Table 5-36 WWDG characteristics (Clock selection 48 MHz PCLK)

Prescaler	WDGTB[1:0]	Minimum overflow	Maximum overflow	Unit
1*4096	0	0.085	5.461	ms
2*4096	1	0.171	10.923	
4*4096	2	0.341	21.845	
8*4096	3	0.683	43.691	

5.3.24. Communication port characteristics

5.3.24.1. I²C bus interface features

The I²C interface meets the timing requirements of the I²C-bus specification and user manual:

- Standard-mode (Sm): 100 kbit/s
- Fast-mode (Fm): 400 kbit/s

The I²C timings requirements is guaranteed by design, provided the I²C peripheral is properly configured and the I²C CLK frequency is greater than the minimum required in the table below.

Table 5-37 Minimum I²C CLK frequency

Symbol	Parameter	Condition	Minimum	Unit
$f_{I2CCLK(min)}$	Minimum I ² C CLK frequency	Standard-mode	2	MHz
		Fast-mode	9	

I²C SDA and SCL pins have analogue filtering, see table below.

Table 5-38 I²C filter characteristics

Symbol	Parameter	Minimum	Maximum	Unit
t_{AF}	Limiting duration of spikes suppressed by the filter (spikes shorter than the limiting duration are suppressed)	50	260	ns

5.3.24.2. Serial peripheral interface (SPI) characteristics

Table 5-39 SPI characteristics

Symbol	Parameter	Condition	Minimum	Maximum	Unit
f_{SCK}	SPI clock frequency	Master mode	-	24	MHz

Symbol	Parameter	Condition	Minimum	Maximum	Unit
$1/t_{c(SCK)}$		Slave mode	-	18	
$t_r(SCK)$ $t_f(SCK)$	SPI clock rise and fall time	Capacitive load: $C = 15 \text{ pF}$	-	6	ns
$t_{su(NSS)}$	NSS setup time	Slave mode	$2 T_{\text{pclk}}$	-	ns
$t_h(NSS)$	NSS hold time	Slave mode	$2 T_{\text{pclk}}$	-	ns
$t_w(SCKH)$ $t_w(SCKL)$	SCK high and low time	Master mode, presc = 2	$T_{\text{pclk}} - 2$	$T_{\text{pclk}} + 1$	ns
$t_{su(MI)}$ $t_{su(SI)}$	Data input setup time	Master mode	1	-	ns
		Slave mode	3	-	
$t_h(MI)$	Data input hold time	Master mode	5	-	ns
		Slave mode	2	-	
$t_a(SO)$	Data output access time	Slave mode	0	$3 T_{\text{pclk}}$	ns
$t_{dis(SO)}$	Data output disable time	Slave mode	$2 T_{\text{pclk}}$	-	ns
$t_v(SO)$	Data output valid time	Slave mode(after enable edge)	0	20	ns
$t_v(MO)$	Data output valid time	Master mode(after enable edge)	-	5	ns
$t_h(SO)$	Data output hold time	Slave mode(after enable edge)	2	-	ns
		Master mode(after enable edge)	1	-	
DuCy(SCK)	SPI slave input clock duty cycle	Slave mode	45	55	%
